## **Abstract of the Invention**

Thermally stable electrolytes for Li-ion batteries obtained with the use of Lewis base additives to the electrolytes are disclosed. The Lewis bases stabilize electrolytes composed of solutions of LiPF<sub>6</sub> in organic carbonates against decomposition at temperatures as high as 85 °C. Additives suitable for stabilizing LiPF<sub>6</sub>-containing electrolytes include amines, example, triethylenediamine (TEDA) and 2,2'-bipyridine (BIPY), phosphines, example, triphenylphosphine (TPP) and tributylphosphine (TBP), and nitrogen-phosphorus bonded compounds such as hexamethoxycyclotriphosphazene ([N=P(OCH<sub>3</sub>)<sub>2</sub>]<sub>3</sub>) (HMOPA), hexamethyl phosphoramide (HMPA), and N-phenyl-P,P,P-trimethylphosphorimidate (PhTMI). These additives are also capable of stabilizing electrolytes in solvents other than carbonates including ethers, esters and sulfones.
